Load Dataset:

The screenshot displays the 'Feature Extractor' application window. At the top, there is a 'Start Processing' button. Below it, the 'Processing Result' section shows a list of processed items, including 'Float Values Converted to Array...', 'Double Values Converted to Array...', and 'Processing Target Data Finished...'. The 'Source Domain Data' table lists network traffic from the source domain, and the 'Target Domain Data' table lists network traffic from the target domain. The 'Target Data' table shows the processed data. The application is running, and the output window shows messages: 'featuresourcedata table truncated!...' and 'featuresourcedata table truncated!...'. The status bar at the bottom indicates 'NetworkAnomalyDetection (run)' is running.
